

Goal: Drop a labeled video, type the watched player’s tag, and let CheatVision cut reviewable kill clips. This does **not** change live detection or the main model.

1 · START, THEN DROP

- 1. Double-click `watch_vod_inbox.bat` and leave it open.
- 2. Start the watcher **before** copying videos. It only notices *new* files.
- 3. When the copy finishes, enter the watched player’s exact in-game tag in the popup.
- 4. The original video stays in the inbox. Review extracted clips before sharing.

2 · WHERE THE VIDEO GOES = THE LABEL

DROP THE VIDEO HERE	USE WHEN	CLIPS ARE SAVED AS
<code>data\vod_inbox\clean\</code>	You have verified the footage is clean.	<code>data\vod_dataset\clean\</code>
<code>data\vod_inbox\cheating\</code>	You have confirmed the kills are cheating.	<code>data\vod_dataset\suspicious\</code>

Do not mix unverified footage. Folder choice is the label. **What it reads:** bottom-left HUD (player) → middle-left kill feed (that player as killer) → mid-right elimination toast (fallback).

LONG VOD

Scans the whole recording. Default clip is **10 sec before** and **4 sec after** each distinct kill.

Best for 5+ minute matches. One file can produce several clips.

SHORT CLIP

Same scan. Uses whatever footage is in the file if a full 14-second window is not available.

If the kill feed / toast is already gone, **no clip is created**. The original stays in the inbox.

TRAIN AND SEND

Trains an offline candidate only if both clean and suspicious clips exist. Path: `data\models\candidates\`. **Not** loaded live.

Spot-check clips, then send `data\vod_dataset\`. Do not commit videos to Git.

TROUBLESHOOTING

NO POPUP?

Watcher must be open first. Copy a *new* file into `clean` or `cheating`. Cancelled prompt: copy again with a new filename.

NO CLIPS?

Check tag spelling. Bottom-left name and a kill indicator must be visible. Short highlight clips often need the feed still on screen.

STILL PROCESSING?

Keep the watcher open until the current video finishes.
