

This sheet is install and update only. Drop-and-clip steps are on the VOD tester how-to. Inbox videos and extracted clips are **not** in git and stay on your PC.

1 · FIRST TIME — SETUP.BAT

1. Install Python 3.11+ from python.org and tick **Add python.exe to PATH**.
2. Clone the repo (needed later for updates):
`git clone https://github.com/SensoredRooster/CheatVision.git`
3. Open the CheatVision folder and double-click `setup.bat`.
4. Answer the GPU and player-detector prompts. **Y** is the usual choice.

`setup.bat` creates `.venv` and installs the app, training extras, VOD OCR, ffmpeg if missing, and the optional player detector. You do not run pip yourself.

A ZIP works once. `update.bat` can pull GitHub changes only from a **git clone**.

2 · LATER — UPDATE.BAT

1. Double-click `update.bat` whenever you want the latest from GitHub.
2. It fast-forwards to `origin/main`.
3. It refreshes app packages, training extras, and VOD OCR.
4. Inbox videos and extracted clips are left untouched.

If the pull fails, local file changes may be in the way. Do not delete your clips. Tell the project owner.

3 · AFTER SETUP OR UPDATE

START	FILE
Live CheatVision app	<code>run.bat</code>
VOD kill-clip watcher	<code>watch_vod_inbox.bat</code>

If something looks missing, run `.venv\Scripts\python.exe tools\setup_check.py`.

TROUBLESHOOTING

PYTHON NOT FOUND?

Reinstall Python, tick Add to PATH, then run `setup.bat` again.

PULL FAILED?

Do not reset. Contact the project owner. Your clips were not deleted.

NOT A GIT CLONE?

Clone the repo. ZIP folders cannot use `update.bat`.

FFMPEG MISSING?

Close this window, open a new one, then run `ffmpeg -version`.
